

CUSTOMER BEHAVIOR READOUT

Customer shopping behavior is a repeat-buyer story with a subscription gap

Descriptive analysis · purchase, product, loyalty and service signals

3,900 purchases give us a broad view of the customer journey

The dataset is wide enough to connect what customers buy with how often they return, what they pay, and which service choices accompany the purchase.

01

Inventory the base

3,900 rows across 18 columns, 25 products, 50 locations and four categories.

02

Measure behavior

Purchase amount, product, category, season, discount, shipping, reviews, subscription status and purchase frequency.

03

Prepare for analysis

Impute 37 missing review ratings by category median, standardize columns, engineer age and frequency fields, and remove redundant promo-code data.

SOURCE • Customer shopping behavior analysis

SO WHAT

The analysis can move from a purchase snapshot to testable retention, merchandising and service decisions

The average order is \$59.76, but the revenue mix is uneven

RECORDED REVENUE BY GENDER

Gender

\$59.76

Average purchase across the dataset.

Male customers generated \$157,890 versus \$75,191 from female customers.

The concentration is stronger by customer mix than by average ticket size, so acquisition and retention should be read together.

SOURCE • Customer shopping behavior analysis • Revenue by gender

SO WHAT

Do not read the \$59.76 average alone; the growth question is who contributes the revenue and who returns.

Clothing is the commercial center of the business

REVENUE AND SALES BY CATEGORY

Clothing leads twice: approximately \$100K in revenue and 1,800 sales.

Accessories follows at approximately \$75K and 1,200 sales. Footwear and Outerwear are materially smaller.

Product leaders

Jewelry · Blouse · Pants · Sandals · Jacket

SOURCE · Customer shopping behavior analysis · Dashboard category performance

SO WHAT

Clothing is the scale engine; use its winning products to anchor merchandising and retention tests.

The customer base is already loyal, but subscriptions are underdeveloped

CUSTOMER COUNTS BY MEASURE

Measure

3,116

customers are Loyal; 701 are Returning and 83 are New.

1,053 subscribe versus 2,847 who do not — a 27% versus 73% split.

The opportunity is conversion of known repeat behavior into a recurring relationship.

SOURCE · Customer shopping behavior analysis · Loyalty and subscription mix

SO WHAT

The next growth pool is already in the customer file: loyal and returning buyers who are not subscri

Repeat buying does not yet translate into subscription adoption

REPEAT BUYERS BY SUBSCRIPTION STATUS

Subscription status

2,518

repeat buyers have no subscription.

958 repeat buyers do have one.

Purchase frequency is a stronger behavioral asset than current subscription conversion suggests.

Next analysis

Compare repeat count, time between purchases, category affinity and discount usage across the two

SO WHAT Treat subscription as a repeat-buyer conversion experiment, not a broad awareness campaign.

Young adults contribute the most revenue, with a relatively balanced age mix

REVENUE BY AGE GROUP

\$62,143

Young Adult revenue leads the mix.

Middle-aged follows at \$59,197; Adult at \$55,978; Senior at \$55,763.

Young Adults also lead sales at approximately 900, followed by Middle-aged at approximately 850.

Implication: prioritize Young Adult growth while keeping messaging relevant across the broad age base.

SOURCE • Customer shopping behavior analysis • Revenue by age group

SO WHAT

Target the leading age cohort without mistaking a modest lead for a concentrated customer base.

Discounts drive demand in a handful of products

PRODUCTS WITH THE HIGHEST DISCOUNT RATES

Product

839

customers used discounts while spending above the average purchase amount.

Reliance is concentrated in Hat, Sneakers, Coat, Sweater and Pants.

Decision rule: keep discounts where incremental basket value and repeat-purchase lift justify the margin cost.

SOURCE • Customer shopping behavior analysis • Discount-dependent products

SO WHAT

Discounting is a product-level lever: test its lift and margin where dependence is highest instead of broadening it indiscriminately.

Small service differences suggest a modest express-shipping premium

AVERAGE PURCHASE BY SHIPPING TYPE

+\$2.02

Express users average \$60.48 versus \$58.46 for Standard shipping.

The gap is directionally positive but too small to treat shipping alone as a major revenue lever.

Recommended test

Connect shipping choice to basket size, customer segment and conversion before changing service strategy.

SOURCE • Customer shopping behavior analysis • Shipping comparison

SO WHAT

Express shipping may signal higher intent or larger baskets; test the relationship before treating it as a revenue lever.

Recommendations should turn descriptive analysis into testable decisions

Each action below connects an observed pattern to a measurable next question.

01

Convert loyalty

Target repeat buyers with exclusive subscription benefits; measure conversion by purchase frequency.

02

Protect margin

Review discount depth and incremental revenue for Hat, Sneakers, Coat, Sweater and Pants.

03

Merchandise winners

Feature Gloves, Sandals, Boots, Hat and Skirt in campaigns, then read demand and repeat response.

04

Target by value

Prioritize Young Adults and high-revenue cohorts without ignoring the balanced age mix.

DECISION LOGIC • observed behavior → focused test → measured commercial outcome

SO WHAT

The immediate agenda is not more description; it is disciplined testing of subscription conversion, discount economics, merchandising and audience value.
